

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1-18. (Cancelled)

19. (Currently Amended) A packaged electronic device ready for electronic use, comprising:

a semiconductor-integrated electronic circuit;

a plastic protective package surrounding and supporting the electronic circuit, the protective package having a window over a portion of the electronic device such that the electronic device can be at least partially activated from outside of said protective package; and

a projecting portion of elastic material projecting from a surface of the electronic device into the window, the projecting portion being structured to enable the electronic device to be activated through the projecting portion when the electronic device is in use, wherein said projecting portion is shaped to form a ring on the electronic circuit.

20. (Cancelled)

21. (Previously Presented) The packaged electronic device according to claim 19 wherein said window has tapering walls toward said electronic circuit.

22. (Currently Amended) ~~The packaged electronic device according to claim 19~~ A packaged electronic device ready for electronic use, comprising:

a semiconductor-integrated electronic circuit;

a plastic protective package surrounding and supporting the electronic circuit, the protective package having a window over a portion of the electronic device such that the electronic device can be at least partially activated from outside of said protective package; and

a projecting portion of elastic material projecting from a surface of the electronic device into the window, the projecting portion being structured to enable the electronic device to be activated through the projecting portion when the electronic device is in use, wherein said projecting portion is surrounded by dyke or barrier formed on a surface of the electronic circuit.

23. (Cancelled)

24. (Previously Presented) The packaged electronic device of claim 19 wherein the electronic circuit includes a proximity sensor.

25. (Currently Amended) A packaged electronic device ready for electronic use, comprising:

a semiconductor-integrated electronic circuit;

a plastic protective package surrounding and supporting the electronic circuit, the protective package having a window over a portion of the electronic device such that the electronic device can be activated from outside of said protective package; and

an elastic protective layer positioned in the window, the protective layer being structured to enable the electronic device to be activated through the protective layer when the electronic device is in use; and

a membrane positioned between the electronic circuit and the protective layer, the membrane having a concave surface facing the electronic circuit so as to leave a recess between the concave surface and the electronic circuit.

26. (Cancelled)

27. (Currently Amended) ~~The packaged electronic device of claim 25~~ A packaged electronic device ready for electronic use, comprising:

a semiconductor-integrated electronic circuit;

a plastic protective package surrounding and supporting the electronic circuit, the protective package having a window over a portion of the electronic device such that the electronic device can be activated from outside of said protective package; and

an elastic protective layer positioned in the window, the protective layer being structured to enable the electronic device to be activated through the protective layer when the electronic device is in use, wherein the protective layer is shaped to form a ring on the electronic circuit.

28. (Previously Presented) The packaged electronic device of claim 25 wherein the window has walls tapering toward said electronic circuit.

29. (Currently Amended) ~~The packaged electronic device of claim 25~~ A packaged electronic device ready for electronic use, comprising:

a semiconductor-integrated electronic circuit;

a plastic protective package surrounding and supporting the electronic circuit, the protective package having a window over a portion of the electronic device such that the electronic device can be activated from outside of said protective package; and

an elastic protective layer positioned in the window, the protective layer being structured to enable the electronic device to be activated through the protective layer when the electronic device is in use, wherein the protective layer is surrounded by dyke or barrier formed on a surface of the electronic circuit.

30. (Previously Presented) The packaged electronic device of claim 25 wherein the electronic circuit includes a proximity sensor.
